

Trainer - current generator (carrying frame)

The first project, which provided that the bicycle will be strengthened behind the steering wheel.

The frame is currently being manufactured, in the process they figured out better and simpler solutions. When the frame will be finished, I will post the new, refined drawing with dimensions.

Last version: the bike will mount behind the front wheel. This will allow you to economize: 1. time of work execution, 2. material, 3. simple construction.

At the last stage of assembly, one of the rolls needs to be made into a lead for a current generator, with the help of which it will be possible to charge electrical devices. The drive from the roll to the generator will be made with the help of two-wheel gears and a chain.
